

Colour Calibration Results

Calibration performed on 2026-10-09_19-43-30

Scan file: colour_configurations

Potential problems with detection of dots

The resolution of this scan seems to be ~71dpi:

scan_RGB_Xerox.pdf

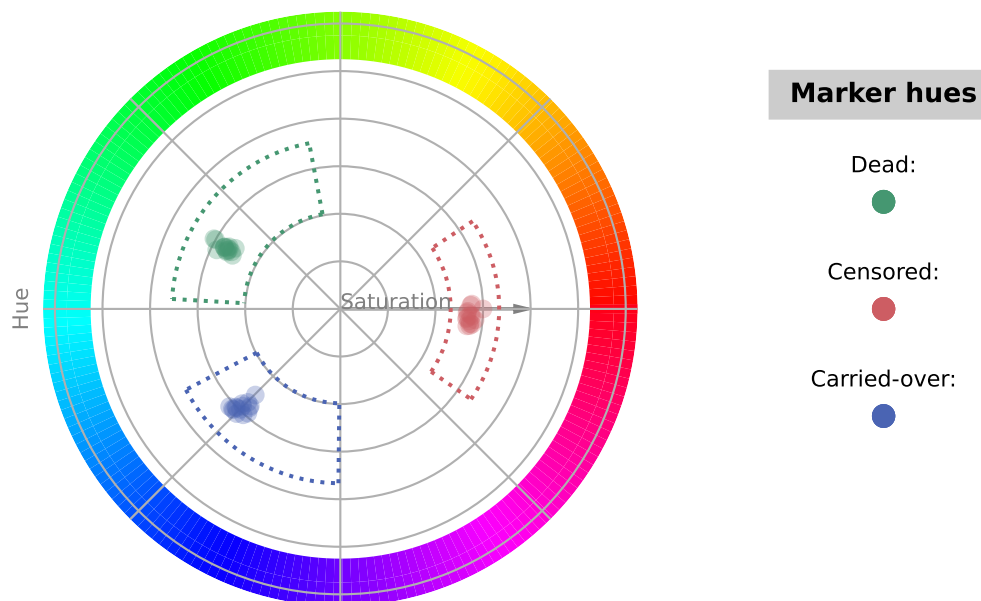

The recommended resolution is >150dpi. Drosben will interpolate to 150dpi.

The process will continue with the available data, but there may be problems after this point.
Consider re-scanning the Colour Calibration Form.

Potential problems with recognition of colour

None

Hue and Saturation windows to determine event colour

The colours need to be distinct to be easily recognised by the programme.

We recommend to use red, blue and green.

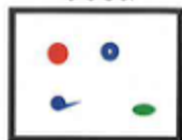

Aim for the marks:

- not touching the box borders
- not overlapping
- being compact, not too thin

Bad

Good

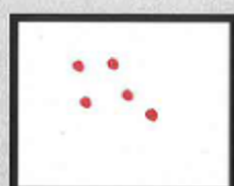

5 marks per box with the FIRST colour marker (recommended red):

1

2

3

5 marks per box with the SECOND marker (recommended blue):

4

5

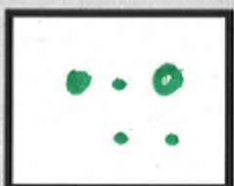

6

5 marks per box with the THIRD marker (recommended green):

7

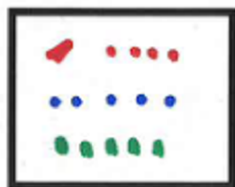

8

9

Five marks of each colour

10

Scan the filled page at ≥ 150 d.p.i. and run the colour calibration test

Dot/colour detection
